Proposal 1 - Crash Course

A website where users will enter a topic and how long they have to learn it. Utilizing a ChatGPT API, the site will output a self-learning course timeline with resources. Another API will be connected to Google Calendar or Notion for the user to organize into their own schedule. The lowest amount of time to learn a subject will be 5 minutes; in that case, the site will simply output a paragraph for the user to read with references. A more typical user story, however, will likely be across a few months split into a weekly course.

Proposal 2 - Hardware Deals

An app that uses reddit API to find deals on r/hardwareswap. The subreddit is a trading platform for computer and gaming hardwares. We can build an application that checks every new post made there, and whenever something that the user is interested in is posted on there, the app shoots an email or notification to the user to help them see the deal before most people.
